Accenture
Let there be change

Prompt Engineering Bootcamp

***SESSION 1**: Industry Standards & Real-World Application*

From Ad-Hoc Prompting → Systematic Approaches

***Duration**: 60 minutes | **Format**: 20min lecture + 35min hands-on + 5min wrap*

Today's Agenda

Time	Activity	Type
0-5 min	Problem & Solution Overview	📊 **LECTURE**
5-15 min	Three Approaches Framework	📊 **LECTURE**
15-20 min	Foundational Patterns	📊 **LECTURE**
20-25 min	🎯 **DEMO: Priority Builder**	🔴 **HANDS-ON**
25-45 min	🎯 **YOUR TURN: Build Priorities**	🔴 **HANDS-ON**
45-55 min	🎯 **COMPARE: Three Approaches**	🔴 **HANDS-ON**
55-60 min	Wrap & Session 2 Preview	📊 **LECTURE**

The Problem: Ad-Hoc AI Prompting

Current State for Most Professionals:

```
Professional: "Hey AI, help me write my FY26 priorities"
AI: *generates generic priorities*
Professional: "These don't capture my impact... try again"
AI: *generates different generic priorities*
Professional: "Still missing key metrics..."
```

❌ Problems:

Every prompt starts from scratch

No team knowledge captured in prompts

Inconsistent results across attempts

Can't reuse successful approaches

The Solution: Industry Standards

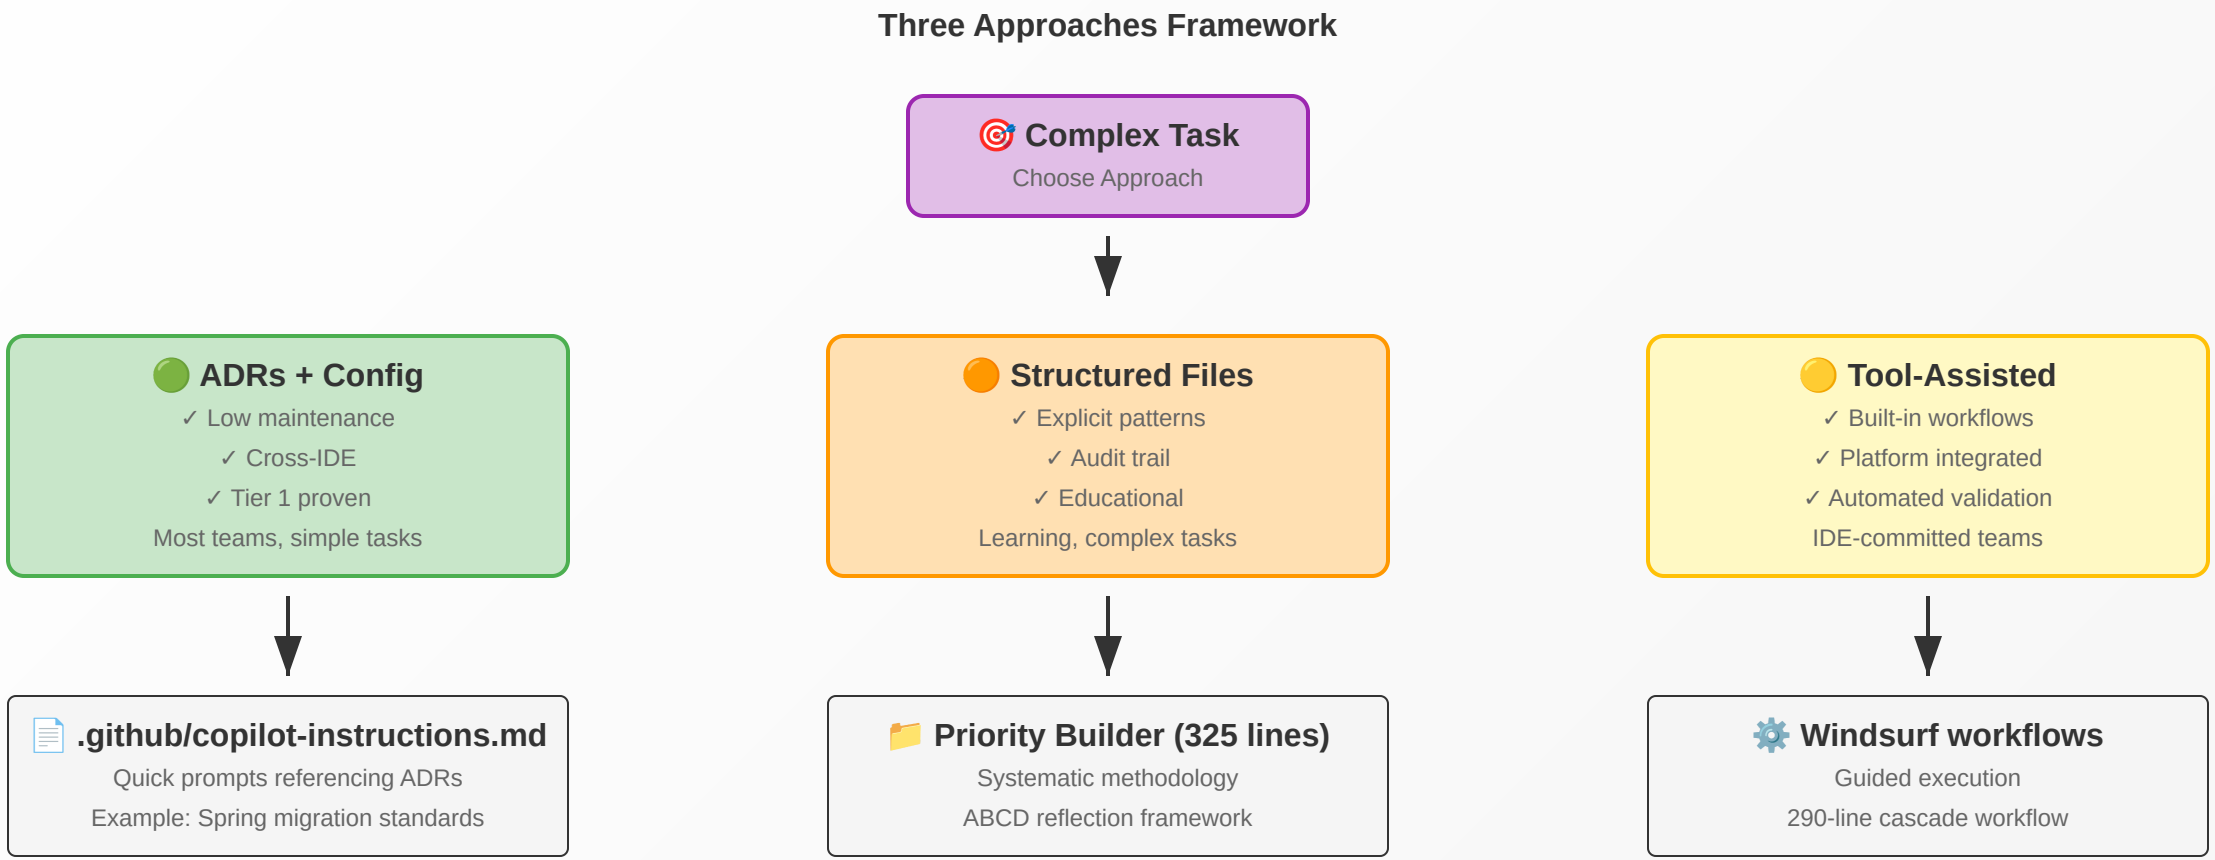
Today you'll learn:

✅ **Three valid approaches** for systematic prompting
✅ **When to use each approach** (decision framework)
✅ **Foundational patterns** in action (not theory)
✅ **Real deliverable** (actual FY26 priorities)

Key insight: Patterns matter more than format. Choose based on team needs, not dogma.

Three Valid Approaches Framework

Accenture
Let there be change



Key Insight: Patterns matter more than format. Choose based on team context, not dogma.

Key Insight: Patterns matter more than format. Choose based on team context, not dogma.

Tier Framework for Evaluation

Accenture
Let there be change

Use this to evaluate any prompt engineering approach:

🟢 Tier 1: Proven (10+ years)

Architecture Decision Records (ADRs)

Few-shot prompting, Chain-of-Thought

Used by: Microsoft, AWS, Google, Netflix

🟡 Tier 2: Production Ready (1-3 years)

`.github/copilot-instructions.md`

ReAct pattern

Growing enterprise adoption

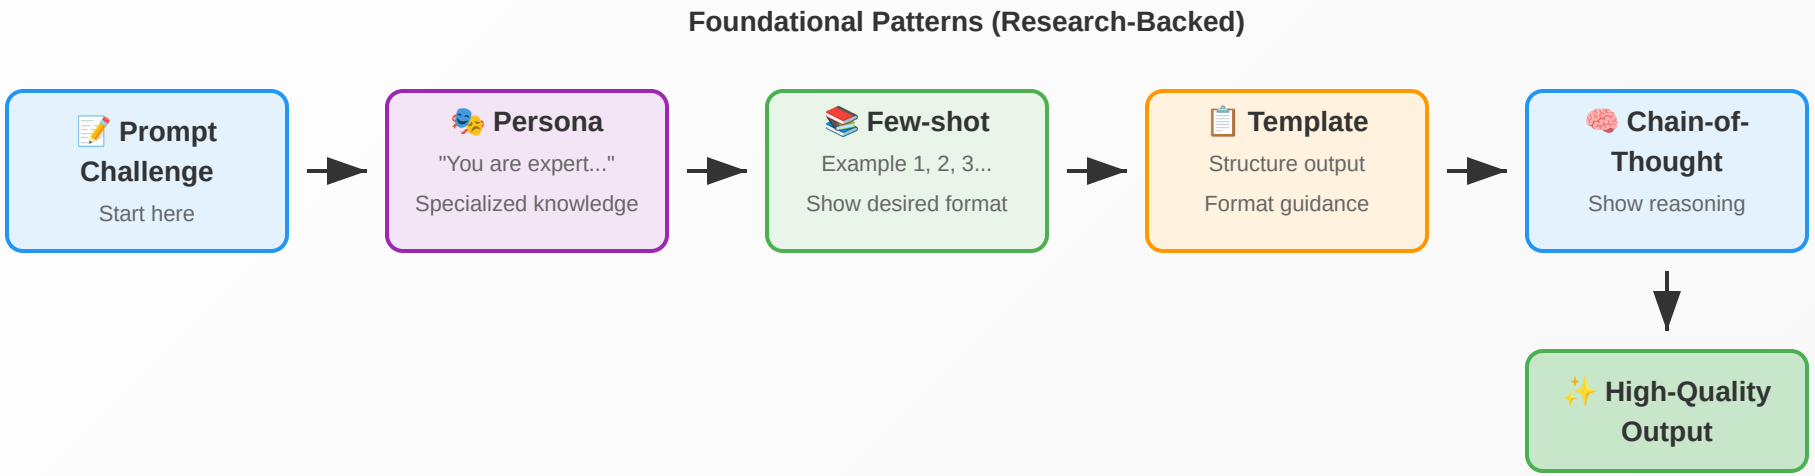
🟠 Tier 3: Experimental (<2 years)

Spec-kit workflows, structured prompt files

Tool-specific approaches

Interesting but unproven at scale

Foundational Patterns (Research-Backed)



Sources: White et al. (2023), Brown et al. (2020), Wei et al. (2022)

Sources: White et al. (2023), Brown et al. (2020), Wei et al. (2022)

Today: See these patterns in a real 325-line Priority Builder system

🎯 HANDS-ON TIME

Next 35 minutes: Build actual FY26 priorities

Put theory into practice with real deliverables

🎯 DEMO: Priority Builder in Action (5 minutes)

What you're about to see:

I'll demonstrate a **325-line Priority Builder Agent** that uses all 4 foundational patterns:

🎭 **Persona**: "You are an expert career coach specializing in Accenture priorities..."

📚 **Few-shot**: Built-in priority examples and ABCD reflections

📋 **Template**: Structured CSV output + formatted summaries

🧠 **Chain-of-Thought**: ABCD reflection framework

Demo scenario: "Senior Analyst - AI Strategy" role
Watch for: How patterns create consistent, high-quality output

🎯 YOUR TURN: Freestyle First (10 minutes)

Task: Create 1 priority for your chosen demo persona

Choose your persona:

Option A: Delivery Lead - Client Experience (8 yrs, team management)

Option B: Tech Lead - Banking Automation (5 yrs, AI/ML specialist)

Option C: Associate Manager - Digital Strategy (6 yrs, transformation)

Challenge: Use your AI tool however you normally would
Goal: 1 priority in ANY category with basic ABCD reflection

Materials: Demo persona descriptions provided

🎯 YOUR TURN: Priority Builder Template (15 minutes)

Task: Use the complete Priority Builder Agent

Process:

Load the prompt: Copy 325-line Priority_Builder_Agent_Prompt.txt

Choose different persona: Pick different option from freestyle round

Follow 20 Questions: Let the agent guide you through analysis

Select version: Conservative, Balanced, or Aspirational

Export CSV: Get production-ready format

Success criteria: Complete ABCD reflections + CSV output ready for Workday

🎯 COMPARE: Three Approaches (10 minutes)

See the same Spring migration task using all three approaches:

Approach A (ADRs + Config):

```
"Following .github/copilot-instructions.md, migrate UserController to Spring Boot 3"
```

Approach B (Structured Files):
Load: knowledge-base.md → specification.md → implementation-plan.md

Approach C (Tool-Assisted):
Windsurf cascade workflow (290-line systematic methodology)

Observe: Same result, different structure and maintenance overhead

Key Insights: Template vs Freestyle

Accenture
Let there be change

What you probably observed:

Freestyle Results:

Generic priorities that could apply to anyone

Missing specific metrics and quantification

Weak ABCD reflections

Inconsistent quality

Priority Builder Results:

Persona-driven expertise and specificity

Structured questioning ensures completeness

Built-in examples guide quality standards

Consistent CSV format for submission

When is overhead worth it? Complex domains, high stakes, repeated use, team consistency

Real-World Application Across Domains

Accenture
Let there be change

The patterns you practiced work everywhere:

Business Applications:

Strategic planning documents

Performance reviews and goal setting

Client presentations and proposals

Training material development

Technical Applications:

Code migration and refactoring

Architecture documentation

Troubleshooting workflows

System design patterns

Key principle: Same systematic thinking, different domains

Session 1 Wrap-Up

What you accomplished:

✅ Learned Three Approaches evaluation framework
✅ Recognized foundational patterns in real prompts
✅ Generated actual FY26 priorities using systematic approach
✅ Compared freestyle vs structured methodologies

Next Session: Advanced patterns + live Java demo

ReAct and Tree of Thoughts for complex reasoning

Interview prep using systematic workflows

Live Spring Boot migration demonstration

Session 2 Preview

Coming up in 60 minutes:

🔄 **Advanced Patterns**: ReAct (Think→Act→Observe) and Tree of Thoughts
🎯 **Interview Prep Workflow**: Systematic approach to strategic positioning
💻 **Live Java Demo**: Spring Boot migration using same patterns
📁 **Spec-kit Methodology**: 3-4 file workflows for complex tasks

Bring for Session 2: A job description you're interested in (or use provided samples)

Questions?

Open discussion on:

Pattern recognition and application

When to use which approach

Adapting to your team context

Challenges and solutions

5-minute break, then Session 2
